

The Parapet wagon is not like other trolleys available in the market today. This machine is designed to be invisible from the ground when not in use. There are no need for brackets and tracks installed on to the façade. The trolley simply requires one NP20 track installed on the inside behind the parapet. In other words: An economical solution that the architects will prefer.

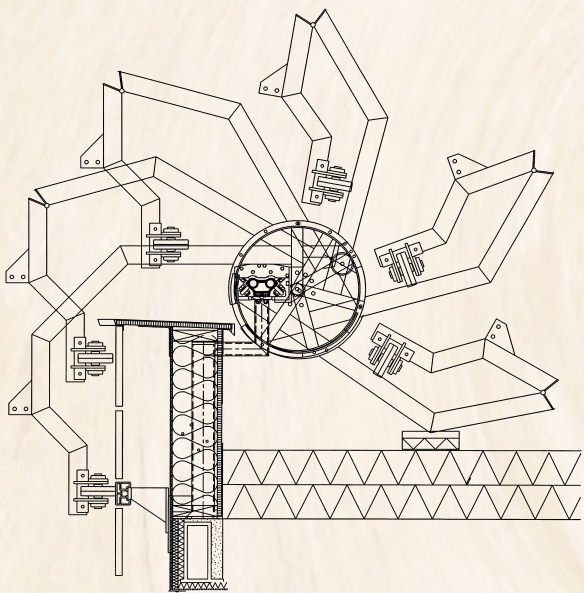

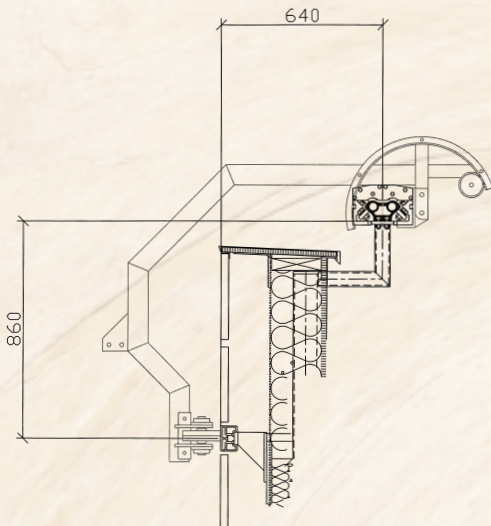

It takes 5 minutes to prepare the parapet wagon for use: just turn the handle, the machine folds out and leans against the façade. Most facades will be able to absorb the pressure applied by the machine. If this is not the case, it is possible to install another profile completely integrated in the façade which can take the loads. This profile can also be used as a design feature.

PARAPET WAGON PW01E

PARAPET WAGON PW01E

- ◆ Traversing speed 6,5 meter/minute
- ◆ Controlled from suspended platform
- ◆ Manual winding mechanism
- ◆ Max. working load limit: 350 kg.
- ◆ Weight 45 kg.

*Setting the machine into operation.
One man – 5 minutes – ready to use.*
